EXAMINER'S AMENDMENT

An Examiner's Amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 C.F.R. § 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the Issue Fee.

The specification has been amended as follows:

on page 4 line ~~17~~ --front air chamber A-- has replaced "shuttle compression chamber 47"; and
on page 4 line ~~17~~¹⁸ --an air vent hole 45-- has replaced "-a radial air inlet hole 44".

The claims has been amended as follows:

in claim 1 line ~~3~~ --a passage between a front air chamber and an air vent hole-- has replaced "the passage between a shuttle compression chamber and a radial air inlet"; and
in claim 1 line ~~9~~ --another-- has replaced "one".

The above changes to the specification and claim correct typographical and antecedent basis errors.

REASONS FOR ALLOWANCE

The following is an Examiner's Statement of Reasons for Allowance: the combination of elements as claimed is deemed to be directed to an unobvious improvement over the prior art as shown by Landrum et al and Cowans. Landrum et al discloses a shuttle valve (60) mounted between a pneumatic piston (45) and a ring plate (63) in a reciprocating pneumatic motor, to control a passage in the piston, between a front air chamber and an air vent hole (65); the shuttle valve including a gasket ring (61) and an oil seal (in 62) around a valve body at opposite ends of the valve body; and a compression spring (90) biasing the valve body to close the passage when the piston is near one end of its travel. Cowans teaches, for a gas driven motor (e.g. fig 6) including a shuttle valve (101) mounted in a piston (93) to control a passage (96) in the piston, and a compression spring (112) biasing the valve body to close the passage when the piston is near one end of its travel; that the compression spring is mounted in a longitudinal center hole in the valve body, having an end cap fastened to one end of the center hole and forming an inside annular flange at the one end of the center hole; a press rod supported on the compression spring inside the center hole, having a front end extending out the valve body and an outward flange supported by the spring and stopped by the inside flange. This improvement comprises that the center hole is a through hole, with the end cap fastened to an end of the through hole opposite an inside annular flange, with the spring supported by the end cap, and the outward flange being around a rear end of the press rod.

Any comments considered necessary by applicant must be submitted no later than the payment of the Issue Fee and, to avoid processing delays, preferably **accompanies** the Issue Fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Lewis, Takahata, McClocklin and Hung refer to fluid motors with shuttle valves.
